Problem Statement:

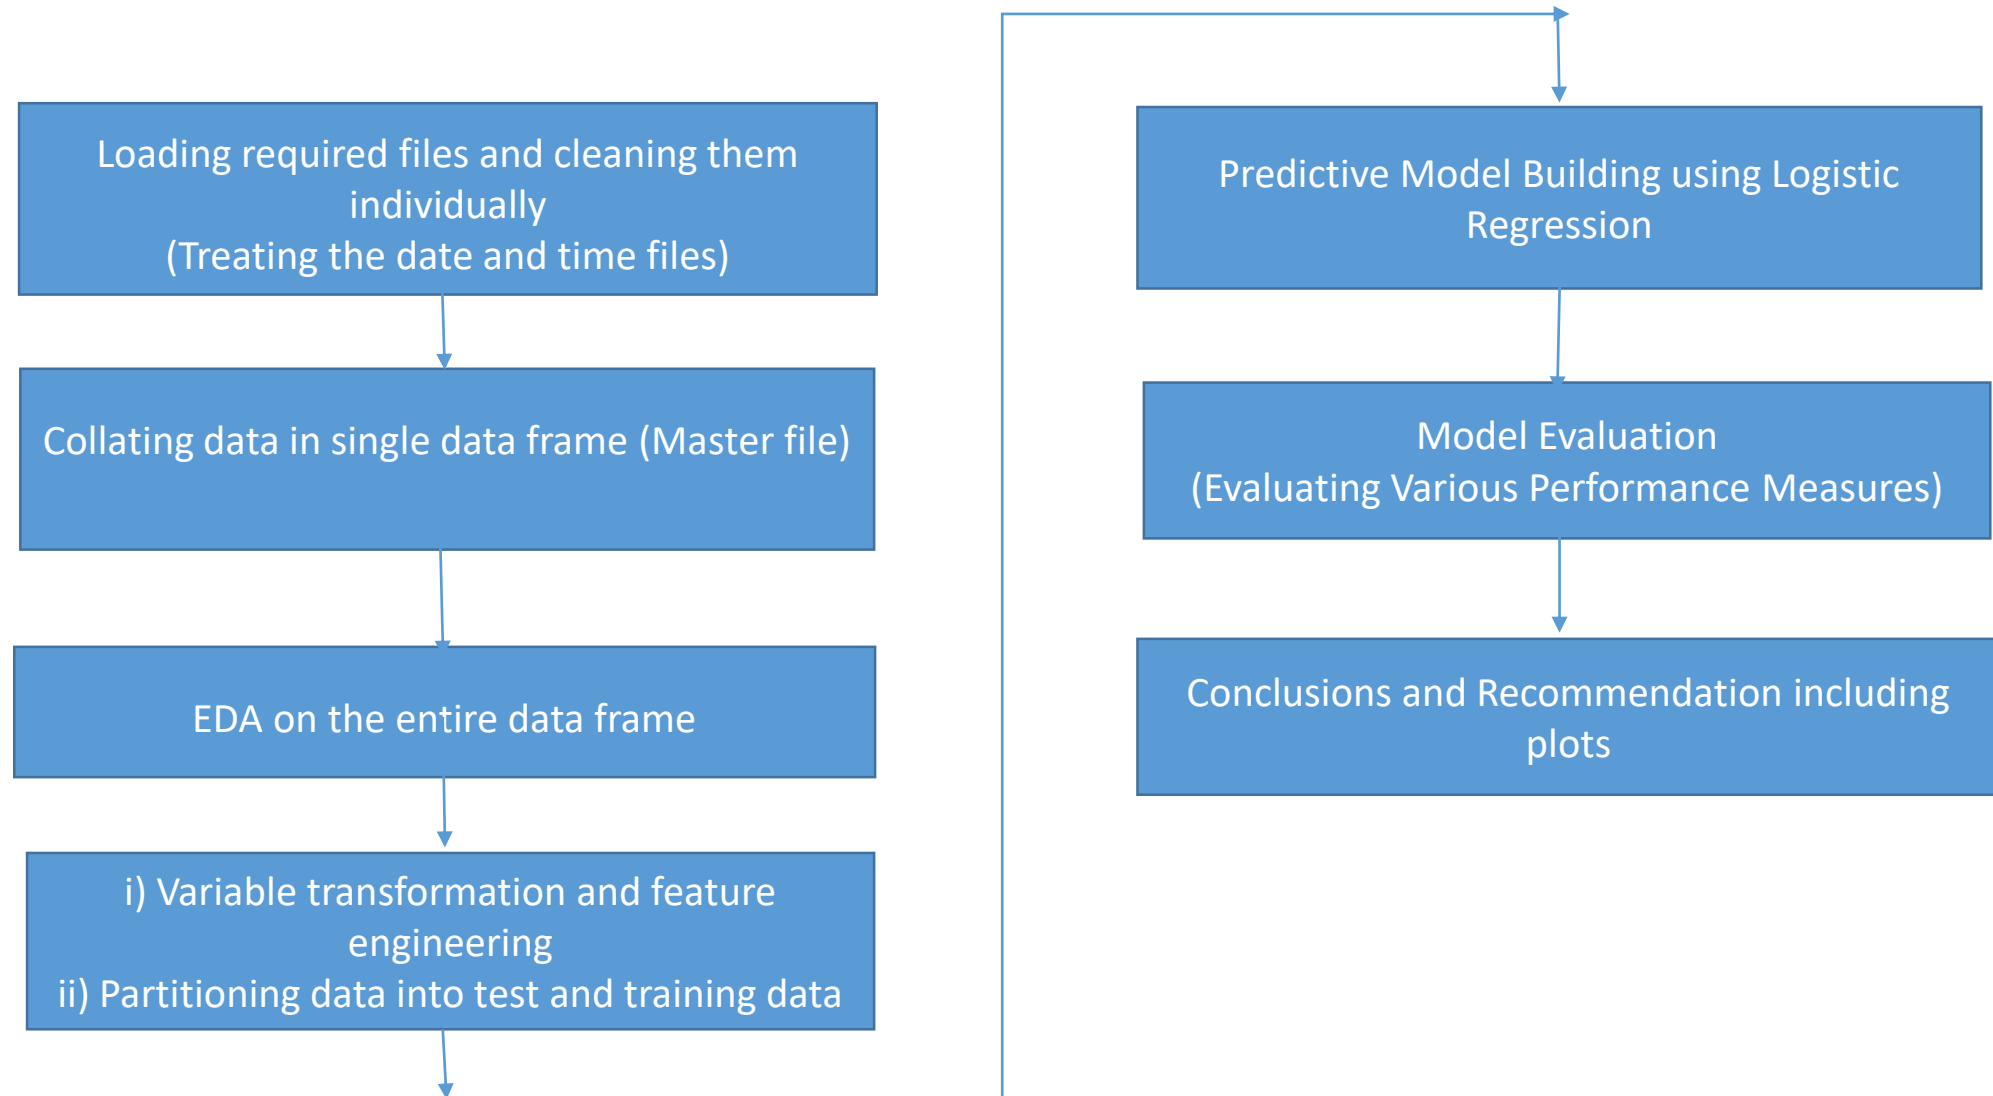

- A 4000 employee company XYZ has 16% attrition rate and thus wants to identify the factors impacting attrition to reduce the costs and improve work efficiency.

Abstract:

The HR Analytics Case Study is being carried out for the company who wants to act upon the cause of attrition in the company. Attrition in any company, be it because of the employees leaving voluntarily or being fired, harms the company's reputation and the issues must be addressed in a right way.

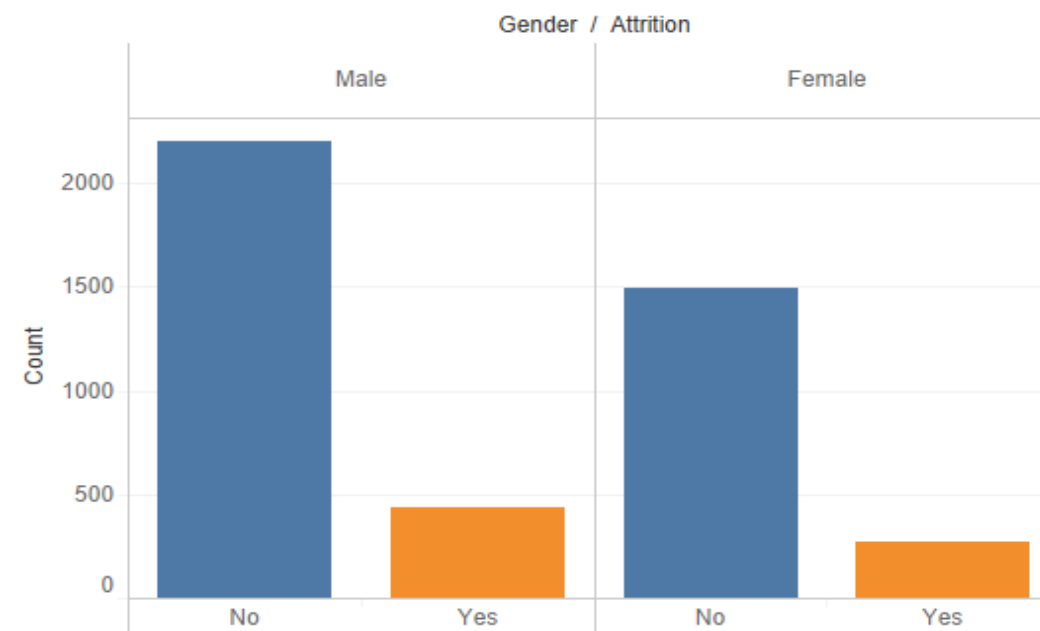

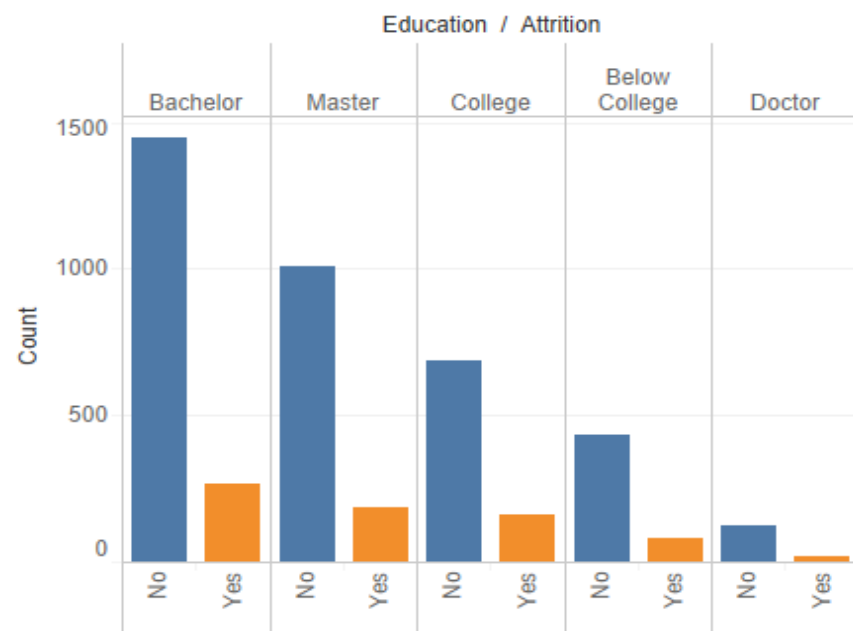

Business Goals:

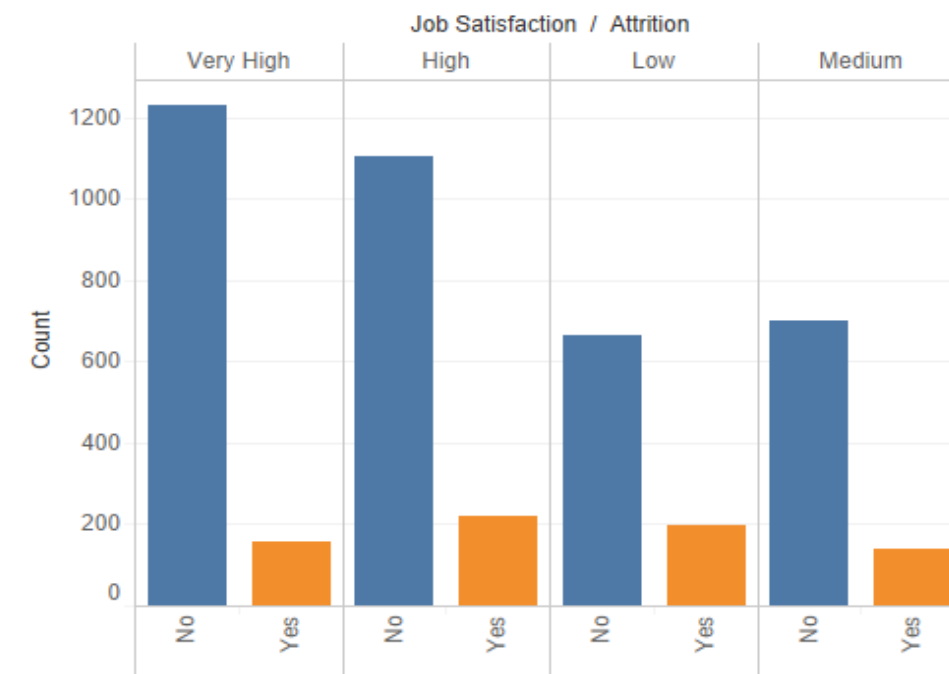

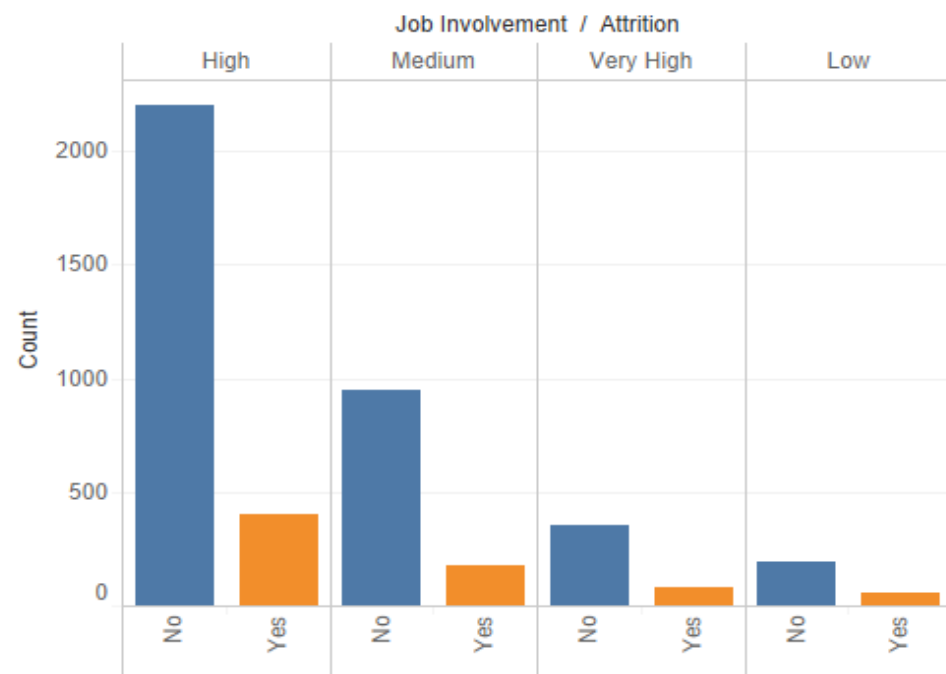

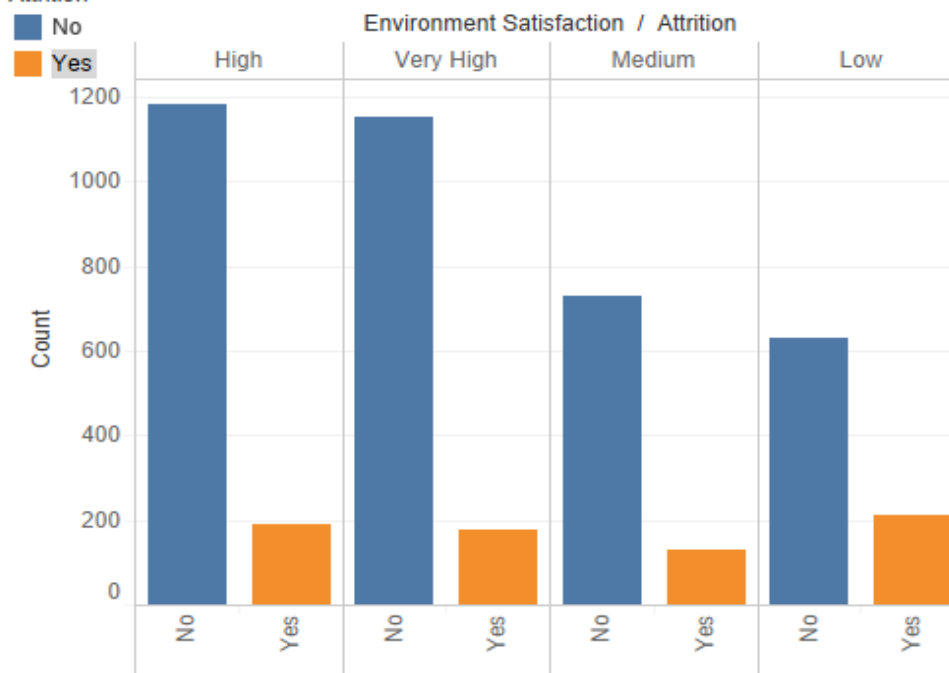

- Find the factors affecting the 16% attrition rate
- Perform Univariate and Multivariate Analysis of variables of interest
- To model the probability of Attrition using Logistic Regression
- Find most important factors leading to attrition to be addressed on priority
- Suggest Methods for minimizing the same.

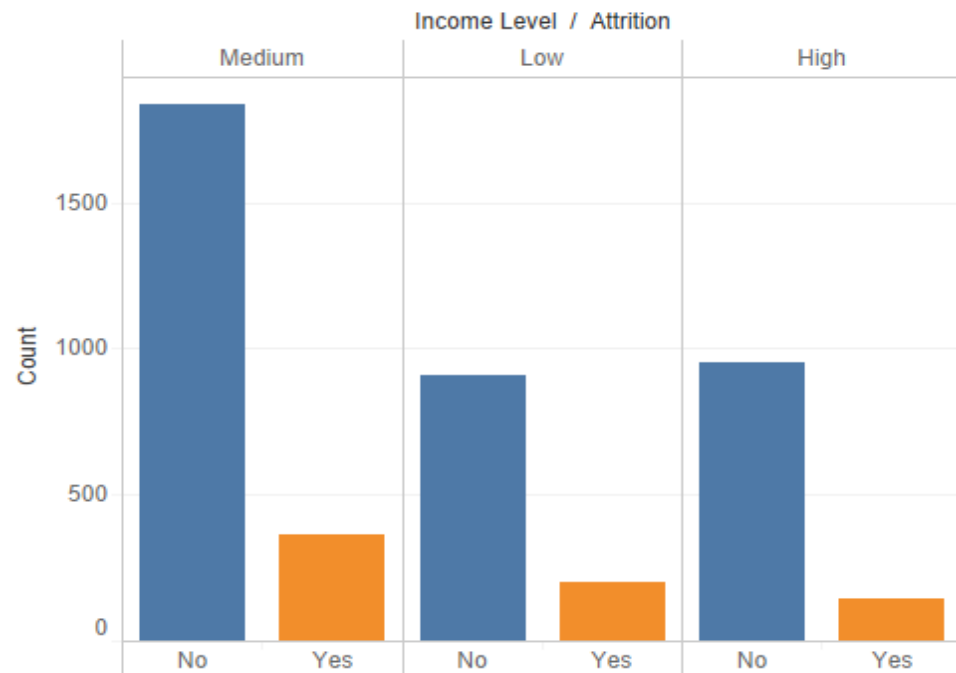

- This bar graph shows that there is about 16% of Attrition of the total employees working in XYZ company.
- Succeeding this, there are graphs showing Attrition with respect to each important variable given in the dataset.
- We had derived three new variables, TenurePerJob, YearsWithoutChange1, YearsWithoutChange2 whose graphs are also shown.

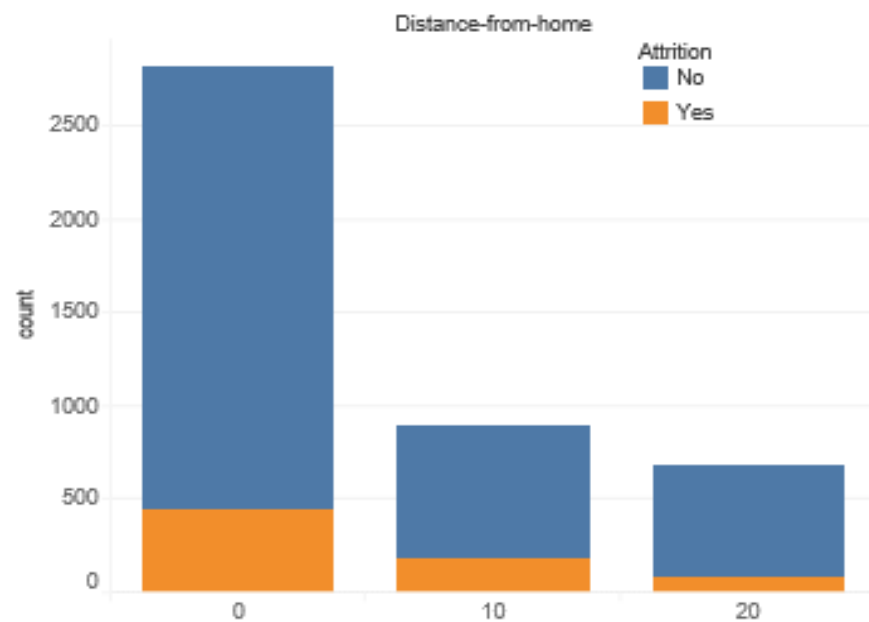

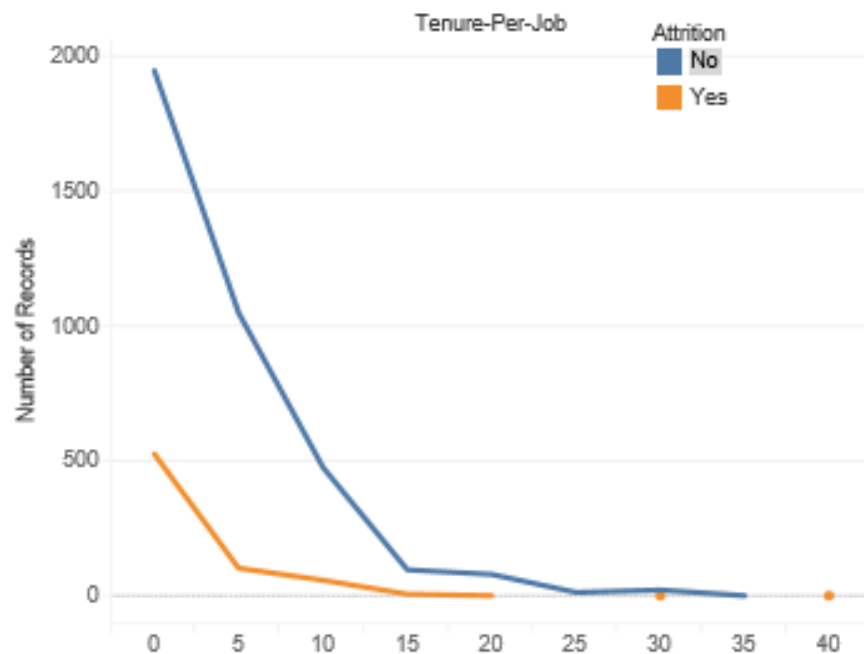

Top factors leading to attrition:

Coefficients:				
	Estimate	Std.Error	z value	Pr(> z)
(Intercept)	-2.91306	0.13699	-21.264	<2.00E-16 ***
NumCompaniesWorked	0.32364	0.05565	5.816	6.04E-09 ***
YearsWithCurrManager	-0.33127	0.06792	-4.878	1.07E-06 ***
YearsWithoutChange2	-0.70848	0.07415	-9.555	<2.00E-16 ***
BusinessTravel.xTravel_Frequently	0.77436	0.12874	6.015	1.80E-09 ***
MaritalStatus.xSingle	1.02349	0.11111	9.212	<2.00E-16 ***
EnvironmentSatisfaction.xLow	1.04796	0.12689	8.259	<2.00E-16 ***
JobSatisfaction.xLow	0.55966	0.13538	4.134	3.56E-05 ***
JobSatisfaction.xVery.High	-0.63536	0.13714	-4.633	3.60E-06 ***
WorkLifeBalance.xBetter	-0.39448	0.11109	-3.551	0.000384 ***
Overtime	1.31834	0.11311	11.656	<2.00E-16 ***

Model Evaluation (test data)

- Selected Cutoff value of probability = 0.1566024
- Accuracy = 0.7346939
- Sensitivity = 0.741784
- Specificity = 0.733333
- KS –statistic = 0.475

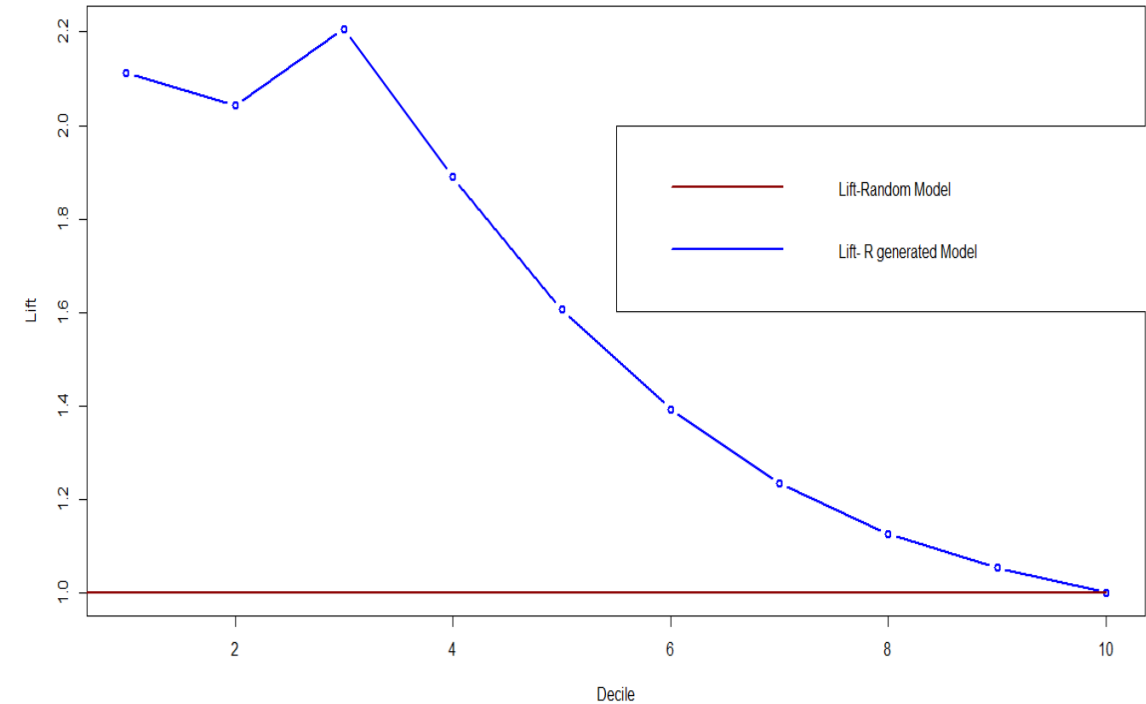

Choosing a cutoff where these 3 lines meet.

And hence cutoff=0.1566

Plotting true Positive against false positive

Gain:

- Among the top 40% employees sorted according to probability, 75.6% of all employees are likely to leave the company.

Lift:

- Model's gain by the end of the 4th decile is 1.89 times that of a random model's gain at the end of 4 deciles.

- **Number of Companies Worked:** We see a clear indication that many people who have worked only in One company before quit a lot.
- **Years With Current Manager:** New Manager is a big cause for quitting. So, If Years With Current Manager is more, Probability of attrition will be less.
- **Business Travel:** Among people who leave, most travel frequently.
- **Environment Satisfaction:** People who are least satisfied with the environment tend to leave.
- **Gender:** We see that majority of separated employees are Male and the reason might be because around 61% of employees in our dataset are Male.
- **Job Satisfaction:** We see higher attrition levels in among lower Job Satisfaction levels.
- **Marital Status:** Attrition is on higher side for Single and lowest for Divorced employees.
- **Overtime:** Larger Proportion of Overtime Employees are quitting.
- **Work Life Balance:** People with better Work Life Balance tend to quit.

- Thus, The company's management should not make employees travel too much.
- They should be kept under great leaders (managers).
- The management should keep a track of employees working for more number of hours and should be given breaks in regular intervals of time or their workload should be distributed equally along with other team members.
- More female employees should be encouraged. (Preferably married)
- While selecting a new candidate the HR should check on how many companies has the person worked in earlier.
- The environment satisfaction should be addressed right away as it is the key to creating better workforce.
